

Phase 1 Data Science

1. Dataset name:

Stack Overflow C++ Questions Dataset.

Please note that this dataset has been directly collected and crawled by our team using a custom Python script.

2. Source URL:

The data has been collected from the official Stack Exchange API:

<https://api.stackexchange.com/docs/advanced-search>

3. Sample data link:

<https://drive.google.com/drive/folders/1iCEL2LHxQYXrB292qBb-D1yDPF3B1ul-?usp=sharing>

4. Project target: We aim to apply NLP techniques to analyze our dataset. We propose three conceptual options for our final task and would appreciate your guidance on selecting the most appropriate one:

- **Option 1 (Difficulty Level Predictor):** Predicting the difficulty level of a question based on its textual content to route complex problems to senior developers.
- **Option 2 (Auto-Tagging System):** Predicting relevant tags for questions based on their textual content.
- **Option 3 (Recommendation System):** Suggesting semantically similar past questions using text embeddings.
